Create mobile application (Android) with web version.

Here's the task for Android app only but we're planning to port app to iOS in the future and we're open to offers if you doing iOS apps as well.

We're planning to make this app open source.

All content downloaded to the app database should be synchronized with web version (the web version should be put to the existing WordPress website).

We want you to use some universal and commonly known development framework. Preferably: Flutter, React Native, Xamarin or PhoneGap.

In your response please provide info about App Development Framework and Database Management System you're planning to use for this project!

The overall functionality of the application should clone this long unsupported app
https://apps.apple.com/ru/app/афиша-мир/id430329886
The servers with all of the content are down for a long time, but if it helps you can check the app.

There's a quick draft of all the pages needed (11 pages) with some connections between. You should add 12th page for «Profile» tab (personal account page). If needed I can provide access to the full Fluidui project, not only preview.
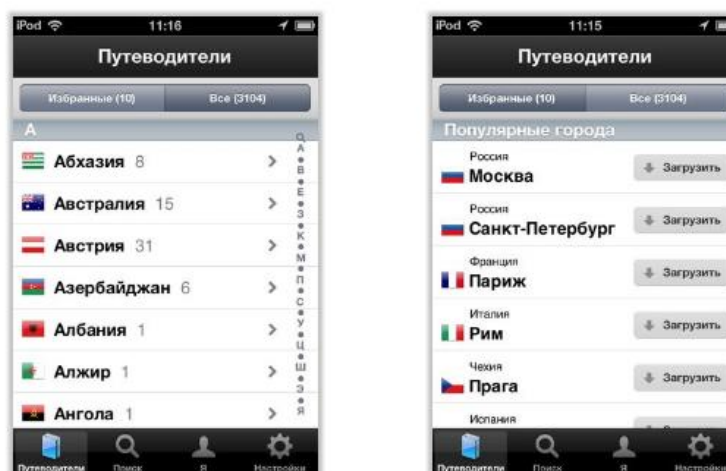

https://www.fluidui.com/editor/live/preview/cF9pYjNGdFdjemwyRUxkTXVhQ2IwejgwZDByVTdvcW1WRQ==

Design of the app should me similar to the old one: clean, minimalistic, no bright colors etc, but we need app to look modern and suitable for actual devices.
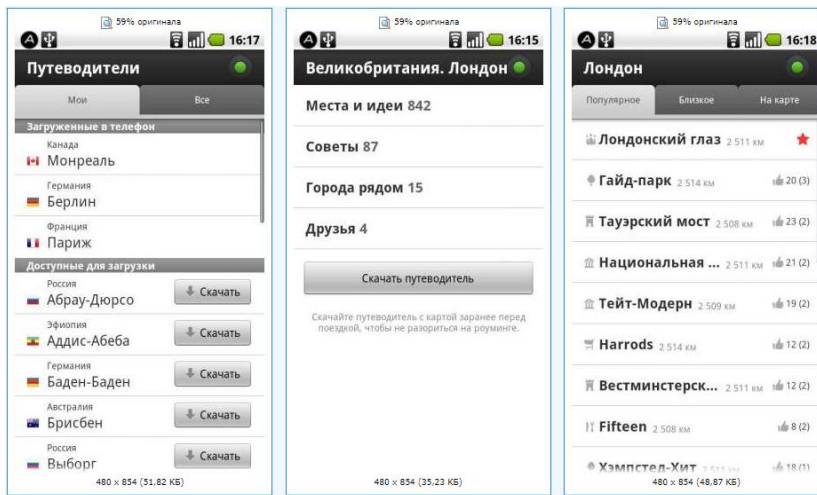

Some screenshots of the donor application below. (remember that we DON'T need to recreate old app's design. We need to clone functionality of the app. Design should be upgraded).

*Numbers of the screens are the same as in the Fluidui project*

Screens 1 and 1.1

*Screens 1.1, 3 and 4*
